

# Cisco Commands Cheat Sheet

# Introduction

Cisco IOS is the backbone software that powers many of Cisco's network devices. For professionals working with these systems, knowing the right commands is crucial.

This article provides a Cisco commands cheat sheet, outlining the most common Cisco IOS commands for configuring, securing and troubleshooting Cisco network equipment. It includes the list of Cisco switch commands, a Cisco router commands list and Cisco network commands. Being familiar with the basic Cisco console commands will aid network administrators in managing Cisco devices efficiently and in line with best practices.

The commands are organized into the following groups:

- Mode control commands
- Basic configuration commands
- Troubleshooting commands
- Routing and VLAN commands
- DHCP commands
- Security commands
- Monitoring and logging commands

## Command Modes

Cisco IOS has several command modes that fall into further categories such as operational and configuration. Each mode serves a slightly unique purpose. For instance, Setup Mode provides the user with an interactive menu guide the user to create an initial configuration file for the device.

The key most common modes are the following:

- **User exec mode** — This mode is the mode you land in when you first log onto a Cisco device. It provides limited access to commands and configuration settings. For instance, this mode enables you to view status using certain show commands but does not enable you to view or edit configurations.
- **Privileged exec mode** — This mode provides access to all commands, enabling more detailed examination and control of the device's operation and configuration.

- **Global Configuration mode:** Global configuration commands apply to features that affect the device as a whole. While Exec and Privileged Exec are read only modes, Global Configuration mode gives the user writable access to modify the active configuration file. To use Global Configuration mode, you first need to enter Privileged EXEC Mode and then execute the configure terminal command although numerous shortcuts are accepted such as config t. Global Configuration mode can be further divided into the following command modes, which permit you to configure different components:
  - Interface configuration mode
  - Subinterface configuration mode
  - Router configuration mode
  - Line configuration mode

## Mode Control Commands

| Command                              | Description  |
|--------------------------------------|--|
| <b>Enable</b>                        | Moves a user from user exec mode into Privileged EXEC mode. Privileged exec mode is indicated by the # symbol in the command prompt. |
| <b>configure terminal</b>            | Logs the user into Global Configuration mode   |
| <b>interface</b> fastethernet/number | Enters interface configuration mode for the specified fast ethernet interface  |

# Basic Configuration Commands List

| Command  | Description  |
|--|--|
| <b>reload</b>  | Reboots the Cisco switch or router   |
| <b>hostname</b> name   | Sets a host name to the current Cisco network device   |
| <b>copy</b> from-location to-location                                | Copies files from one file location to another   |
| <b>copy running-config startup-config</b>                            | Replaces the startup config with the active config when the Cisco network device initializes                                   |
| <b>copy startup-config running-config</b>                            | Merges the startup config with the currently active config in RAM  |
| <b>write erase</b><br><b>erase startup-config</b>                    | Deletes the startup config   |
| <b>ip address</b> ip-address mask                                    | Assigns the specified IP address and subnet mask   |
| <b>shutdown</b><br><b>no shutdown</b>                                | Shuts the interface down (shutdown) or brings it up (no shutdown)  |
| <b>ip default-gateway</b> ip_address                                 | Sets the default gateway on the Cisco device   |
| <b>show running-config</b>   | Displays the current configuration of the device   |
| <b>show startup-config</b>   | Displays the saved configuration stored in the device's NVRAM, which will be loaded when the device starts up                  |
| <b>description</b> string  | Assigns the specified description to an interface  |
| <b>show running-config interface</b><br><b>interface</b> slot/number | Displays the running configuration for the specified interface   |
| <b>show ip interface</b> [type number]                               | Displays the status of a network interface as well as a detailed listing of its IP configurations and related characteristics. |
| <b>ip name-server</b> serverip-1 serverip-2                          | Sets the IP address of or more DNS servers that the device can use to resolve hostnames to IP addresses.                       |

# Troubleshooting Cisco Commands List

| Command  | Description   |
|--|---|
| <b>ping</b> {hostname   system-address}<br>[source source-address] | Used to diagnose basic network connectivity   |
| <b>speed</b> {10   100   1000   auto}                              | Either configures the transmission speed of a network interface to the specified value in megabits per second (Mbps), or enables automatic speed detection for the port |
| <b>duplex</b> {auto   full   half}                                 | Sets duplex to half, full or auto   |
| <b>cdp run</b><br><b>no cdp run</b>                                | Enables or disables Cisco Discovery Protocol (CDP) for the device   |
| <b>show mac address-table</b>                                      | Displays the MAC address table  |
| <b>show cdp</b>  | Shows whether CDP is enabled globally   |
| <b>show cdp neighbors</b> [detail]                                 | Lists summary (or detailed) information about each neighbor connected to the device   |
| <b>show interfaces</b>   | Displays detailed information about interface status, settings and counters   |
| <b>show interface status</b>                                       | Displays the interface line status  |
| <b>show interfaces switchport</b>                                  | Displays many configuration settings and current operational status, including VLAN trunking details  |
| <b>show interfaces trunk</b>                                       | Lists information about the currently operational trunks and the VLANs supported by those trunks  |
| <b>show vlan</b><br><b>show vlan brief</b>                         | Lists each VLAN and all interfaces assigned to that VLAN but does not include trunks  |
| <b>show vtp status</b>   | Lists the current VLAN Trunk Protocol (VTP) status, including the current mode  |

# Routing and VLAN Commands

| Command   | Description   |
|---|---|
| <b>show ip route</b>  | Displays the current state of the IP routing of all known routes that are either statically configured or learned dynamically through a routing protocol  |
| <b>ip route</b> network-number network-mask {ip-address   interface}                                      | Sets a static route in the IP routing table   |
| <b>router rip</b>   | Enables a Routing Information Protocol (RIP) routing process, which places you in router configuration mode   |
| <b>network</b> ip-address   | Associates a network with a RIP routing process   |
| <b>version 2</b>  | Configures the software to receive and send only RIP version 2 packets  |
| <b>no auto-summary</b>  | Disables automatic summarization  |
| <b>default-information originate</b>  | Generates a default route into RIP  |
| <b>passive-interface</b> interface  | Sets the specified interface to passive RIP mode, which means RIP routing updates are accepted by, but not sent out of, the interface   |
| <b>show ip rip database</b>   | Displays the contents of the RIP routing database   |
| <b>ip nat</b> [inside   outside]  | Configure Network Address Translation (NAT), which allows private IP addresses on a local network to be translated into public IP addresses before being sent over the internet   |
| <b>ip nat inside source</b> {list{access-list-number   access-list-name}} interface type number[overload] | Establishes dynamic source translation. Use of the "list" keyword enables you to use an ACL to identify the traffic that will be subject to NAT. The "overload" option enables the router to use one global address for many local addresses. |
| <b>ip nat inside source static</b> local-ip global-ip   | Establishes a static translation between an inside local address and an inside global address   |
| <b>vlan</b>   | Creates a VLAN and enters VLAN configuration mode for further definitions   |

| Command   | Description   |
|---|---|
| <b>switchport access vlan</b>                       | Sets the VLAN that the interface belongs to   |
| <b>switchport trunk encapsulation dot1q</b>         | Specifies 802.1Q encapsulation on the trunk link  |
| <b>switchport access</b>                            | Configures a specific Ethernet port on a switch to operate in access mode to accommodate an end device such as a computer, server or printer. The port must then be assigned to a single VLAN.  |
| <b>vlan vlan-id</b> [name vlan-name]                | Configures a specific VLAN name (1 to 32 characters)  |
| <b>switchport mode</b> { access   trunk }           | Configures the VLAN membership mode of a port. <ul style="list-style-type: none"> <li>▪ The access port is set to access unconditionally and operates as a non-trunking, single VLAN interface that sends and receives non-encapsulated (non-tagged) frames. An access port can be assigned to only one VLAN.</li> <li>▪ The trunk port sends and receives encapsulated (tagged) frames that identify the VLAN of origination. A trunk is a point-to-point link between two switches or between a switch and a router.</li> </ul> |
| <b>switchport trunk</b> { encapsulation { dot1q } } | Sets the trunk characteristics when the interface is in trunking mode. In this mode, the switch supports simultaneous tagged and untagged traffic on a port.  |
| <b>encapsulation dot1q vlan-id</b>                  | Defines the matching criteria to map 802.1Q frames ingress on an interface to the appropriate service instance  |
| <b>show spanning-tree</b>                           | Provides detailed information about the Spanning Tree protocol for all VLANs  |

# DHCP Commands

| Command  | Description   |
|--|---|
| <b>ip address dhcp</b>                                       | Acquires an IP address on an interface via DHCP   |
| <b>ip dhcp pool name</b>                                     | Used to configure a DHCP address pool on a DHCP server and enter DHCP pool configuration mode                         |
| <b>domain-name</b> domain                                    | Specifies the domain name for a DHCP client   |
| <b>network</b> network-number [mask]                         | Configures the network number and mask for a DHCP address pool primary or secondary subnet on a Cisco IOS DHCP server |
| <b>ip dhcp excluded-address</b> ip-address [last-ip-address] | Specifies IP addresses that a DHCP server should not assign to DHCP clients   |
| <b>ip helper-address</b> address                             | Enables forwarding of UDP broadcasts, including BOOTP, received on an interface                                       |
| <b>default-router</b> address[address2 ... address8]         | Specifies the default routers for a DHCP client   |

# DHCP Commands

| Command  | Description   |
|--|---|
| <b>Password</b> pass-value   | Lists the password that is required if the login command (with no other parameters) is configured   |
| <b>username</b> name <b>password</b> pass-value                                      | Defines one of possibly multiple user names and associated passwords used for user authentication. It is used when the <b>login local</b> line configuration command has been used. |
| <b>enable password</b> pass-value  | Defines the password required when using the <b>enable</b> command  |
| <b>enable secret</b> pass-value  | Sets the password required for any user to enter enable mode  |
| <b>service password-encryption</b>   | Directs the Cisco IOS software to encrypt the passwords, CHAP secrets and similar data saved in its configuration file  |
| <b>ip domain-name</b> name   | Configures a DNS domain name  |
| <b>crypto key generate rsa</b>   | Creates and stores (in a hidden location in flash memory) the keys that are required by SSH   |
| <b>transport input</b> {telnet   ssh}  | Defines whether Telnet or SSH access is allowed into this switch. Both values can be specified in a single command to allow both Telnet and SSH access (default settings).          |
| <b>access-list</b> access-list-number {deny   permit} source [source-wildcard] [log] | Defines a standard IP access list   |
| <b>access-class</b>  | Restricts incoming and outgoing connections between a particular VTY (into a basic Cisco device) and the addresses in an access list  |
| <b>ip access-list</b> {standard   extended} {access-list-name   access-list-number}  | Defines an IP access list by name or number   |

| Command   | Description   |
|---|---|
| <b>permit source</b> [source-wildcard]  | Allows a packet to pass a named IP ACL. To remove a permit condition from an ACL, use the “no” form of this command.                        |
| <b>deny source</b> [source-wildcard]  | Used to set conditions in a named IP ACL that will deny packets. To remove a deny condition from an ACL, use the “no” form of this command. |
| <b>ntp peer</b> <ip-address>  | Configures the software clock to synchronize a peer or to be synchronized by a peer   |
| <b>switchport port-security</b>   | Enables port security on the interface  |
| <b>switchport port-security maximum maximum</b>                                 | Sets the maximum number of secure MAC addresses on the port   |
| <b>switchport port-security mac-address</b><br>{mac-addr   {sticky [mac-addr]}} | Adds a MAC address to the list of secure MAC addresses. The “sticky” option configures the MAC addresses as sticky on the interface.        |
| <b>show port security</b> [interface interface-id]                              | Sets the action to be taken when a security violation is detected   |
| <b>show port security</b> [interface interface-id]                              | Displays information about security options configured on the interface   |

# Monitoring and Logging Commands

| Command                   | Description  |
|---------------------------|--|
| <b>logging ip</b> address | Configures the IP address of the host that will receive the system logging (syslog) messages   |
| <b>logging trap level</b> | Used to limit messages that are logged to the syslog servers based on severity. Specify the number or name of the desired severity level at which messages should be logged. |
| <b>show logging</b>       | Displays the state of system logging (syslog) and the contents of the standard system logging buffer   |
| <b>terminal monitor</b>   | Sends a copy of all syslog messages, including debug messages, to the Telnet or SSH user who issues this command   |

# Simplify Monitoring of Cisco Devices

with Netwrix Auditor for Network Devices

Get detailed audit information on configuration changes.

Track successful and failed VPN logon attempts.

Stay on top of each attempt to log in directly to a Cisco device.

Continuously monitor devices for hardware malfunctions.

Detect scanning threats before attackers take control of the entire network infrastructure.

[Download Free 20-Day Trial](#)

# About Netwrix

Netwrix makes data security easy. Since 2006, Netwrix solutions have been simplifying the lives of security professionals by enabling them to identify and protect sensitive data to reduce the risk of a breach, and to detect, respond to and recover from attacks, limiting their impact. More than 13,500 organizations worldwide rely on Netwrix solutions to strengthen their security and compliance posture across all three primary attack vectors: data, identity and infrastructure.
